Figure 2-2: A schematic diagram of an electrical circuit. The circuit consists of a rectangular loop. At the top is a circular component with a vertical line through its center and two arrows pointing towards it from above. At the bottom are two small circles connected in series. On the right side is a larger circle containing several dots. The left side is a simple vertical wire.

Figure 2-5: A graph showing a linear relationship. The vertical axis (y-axis) has an upward arrow and a label 'y' at the top. The horizontal axis (x-axis) has a rightward arrow and a label 'x' at the end. A straight line with a positive slope is plotted, intersecting the x-axis at a point marked with a tick. Four data points, represented by solid black circles, are plotted along the line. The line starts from a point on the y-axis and extends upwards and to the right.

Figure 2-3: A schematic diagram of an electrical circuit. The circuit consists of a battery (represented by two parallel lines of unequal length) connected in series with a switch (represented by two parallel lines meeting at a point) and a light bulb (represented by a circle with a filament inside). The circuit is enclosed in a rectangular loop. A parallel branch at the top contains a component that is emitting wavy lines, representing heat or light. The circuit is enclosed in a rectangular loop with a dashed vertical line in the top branch.

Figure 3-1: A diagram of a rectangular block divided into several vertical sections of varying widths. The sections are separated by thin vertical lines, and the entire block is enclosed in a rectangular frame. The diagram illustrates the structure of a rectangular block divided into several vertical sections of varying widths.

[illegible]

Braille text block containing multiple lines of Braille characters.

Braille text representing the word "RADIATION" in all caps.

Braille text representing the word "DANGER" in all caps.
